1. Introduction

This module provides the entry point of the system, including user registration, login, and role-based navigation.

It supports three types of users: Teaching Assistants (TA), Management Officers (MO), and Administrators (Admin).

---

2. System Overview

Upon launching the system, users are presented with the main interface:

- Login
- Register

This corresponds to the homepage design in the prototype.

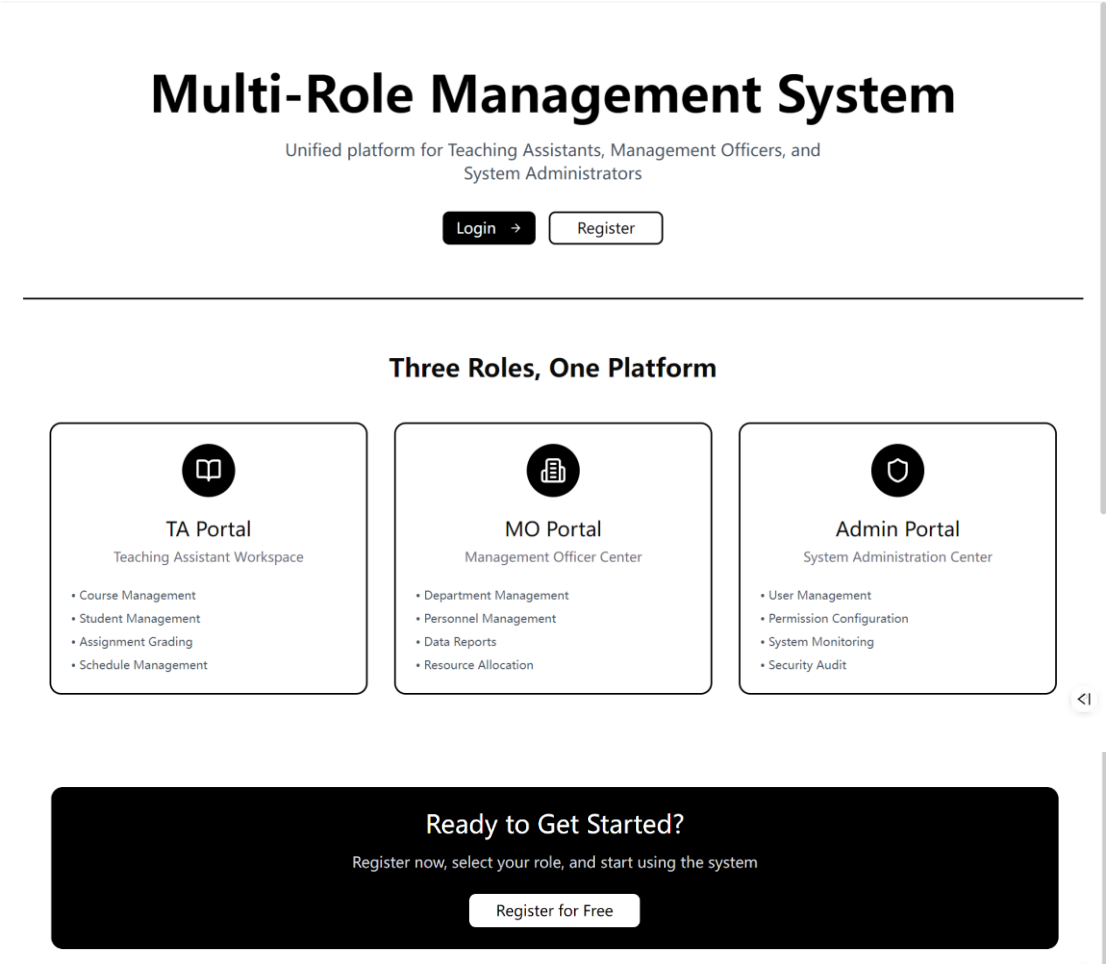
---

3. Homepage (Main Entry)

Workflow:

1. User opens the system
2. The main menu is displayed:
    - Login
    - Register
3. User selects an option to proceed

Note: In the current implementation, this is displayed via a command-line interface.



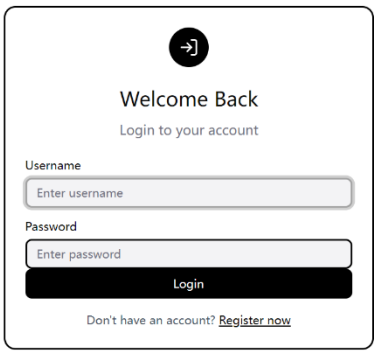
---

4. Login Workflow

Based on the “Welcome Back” interface:

Steps:

1. Select **Login**
2. Enter username
3. Enter password
4. Click/Login (submit input)
5. System verifies credentials
6. If successful:
    - User is redirected based on role:
        - TA → TA Portal
        - MO → MO Portal
        - Admin → Admin Portal
7. If failed:
    - Error message is displayed



---

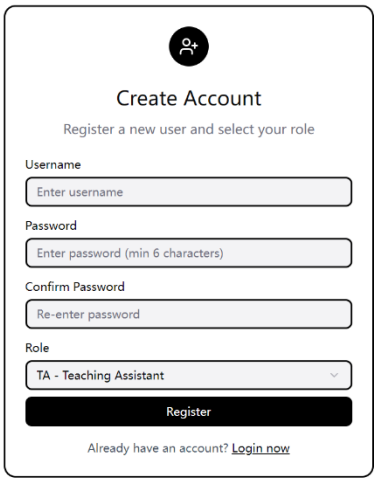
5. Registration Workflow

Based on the “Create Account” interface:

Steps:

1. Select **Register**
2. Enter username
3. Enter password (minimum 6 characters)
4. Confirm password
5. Select role:
    - TA – Teaching Assistant
    - MO – Management Officer
    - Admin – System Administrator

6. Click Register
7. System checks:
    - Username uniqueness
    - Password validity
8. If successful:
    - Account is created
9. If failed:
    - Error message is shown



---

6. Role-Based Navigation

After login, the system redirects users to different modules:

- **TA Portal**
  Course management, grading, scheduling
- **MO Portal**
  Department and personnel management
- **Admin Portal**
  User management and system monitoring

Note: Currently implemented as placeholder navigation in the prototype.

---

7. Logout

Users can log out, and the session will be cleared.

---

8. Design Consistency

The system implementation follows the UI prototype designed in Figma.
Due to prototype constraints, a command-line interface is used, while maintaining consistent workflow and logic.
