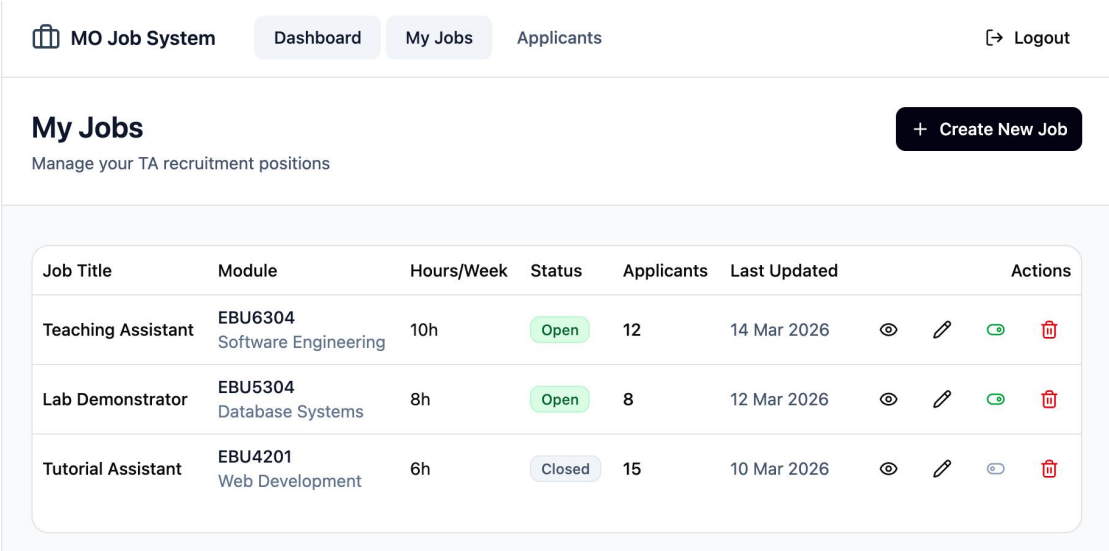
MO Job Management Module

(1) My Jobs (Job Management List)

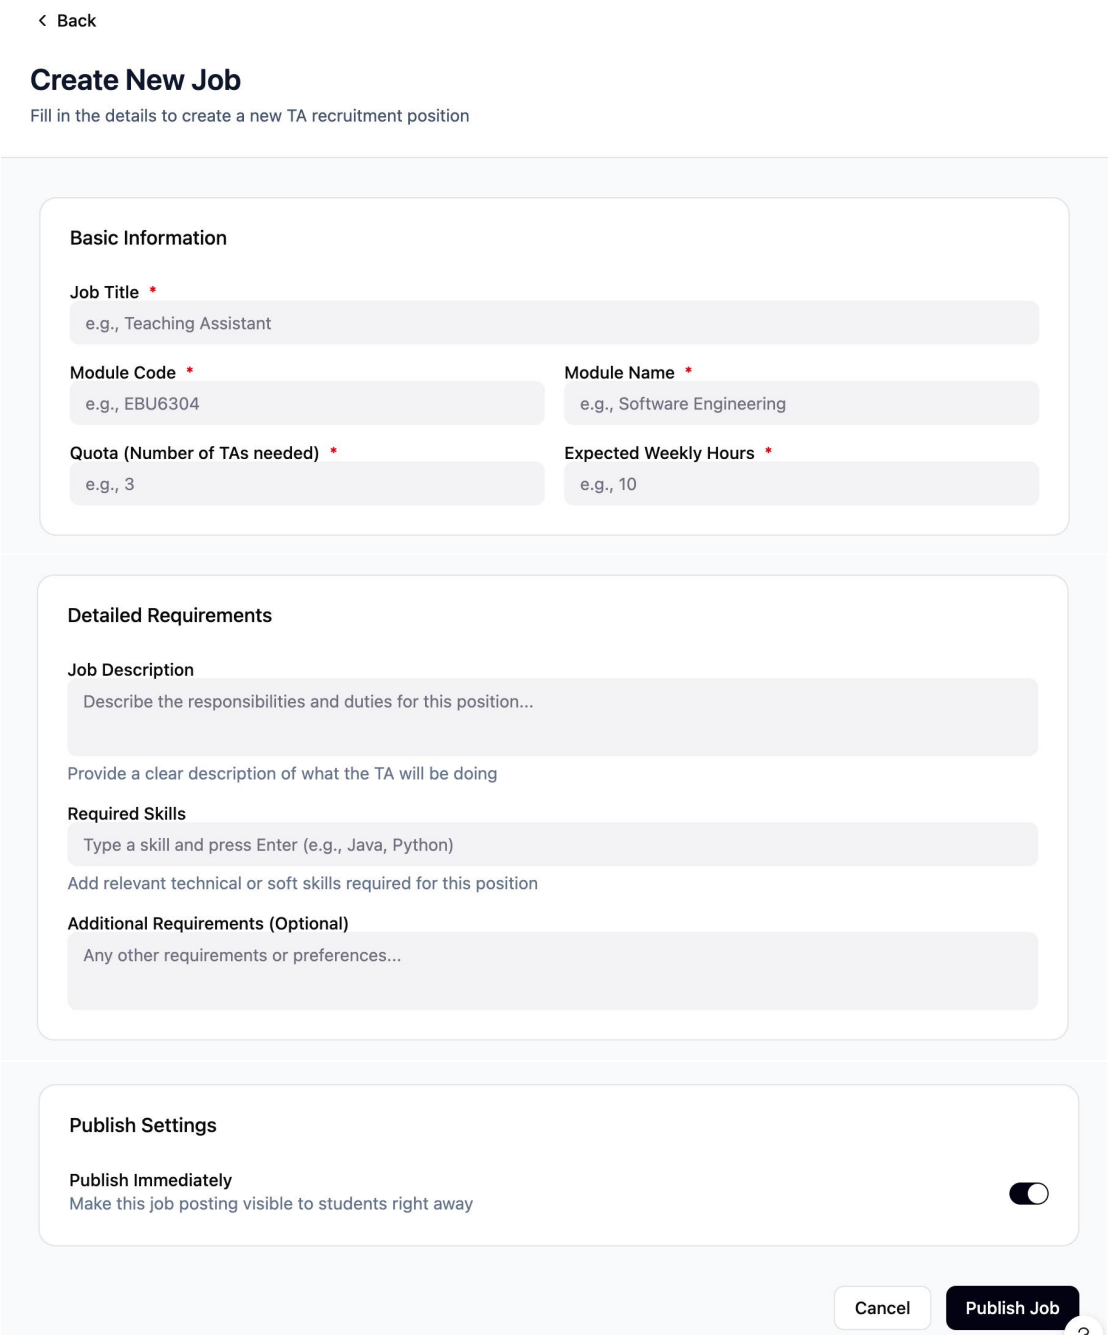


The MO-side job management workflow primarily centers around the "My Jobs" page. After logging into the system, the Module Organiser (MO) can navigate to this page via the top navigation bar. This page serves as the central hub for discovering, managing, and tracking the status of all created TA positions.

At the top right corner, a prominent "+ Create New Job" button allows the MO to initiate the job posting workflow. The main body of the page presents a comprehensive data table listing all existing job postings. Each row clearly displays essential information including Job Title, Module code and name, Expected Hours/Week, current Status (Open or Closed), the total number of Applicants, and the Last Updated date.

To facilitate efficient management, the rightmost "Actions" column provides quick operational icons for each position. The MO can click the eye icon to view detailed job information, the pencil icon to edit the posting, the toggle switch to seamlessly change the job status between Open and Closed (which directly determines its visibility on the TA side), and the trash bin icon to delete the record.

(2) Create New Job



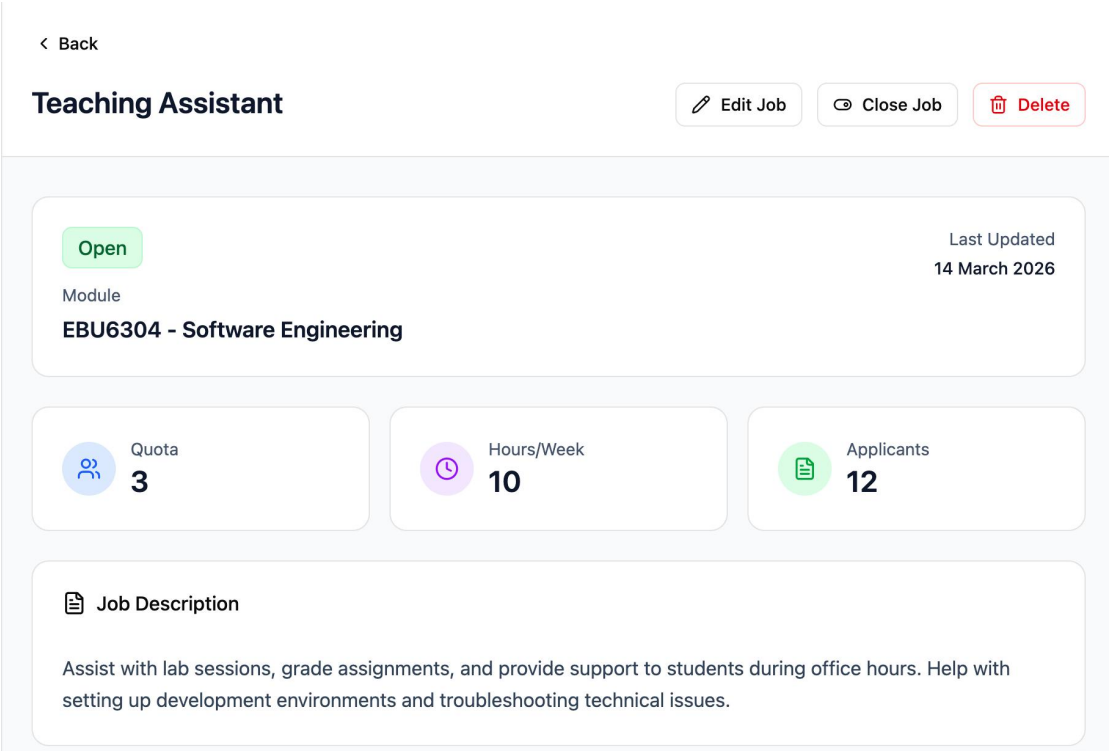
When the MO clicks the "+ Create New Job" button on the Job Management page, the system navigates to the Create New Job page. This is the core operational interface where the MO formally inputs and publishes recruitment demands.

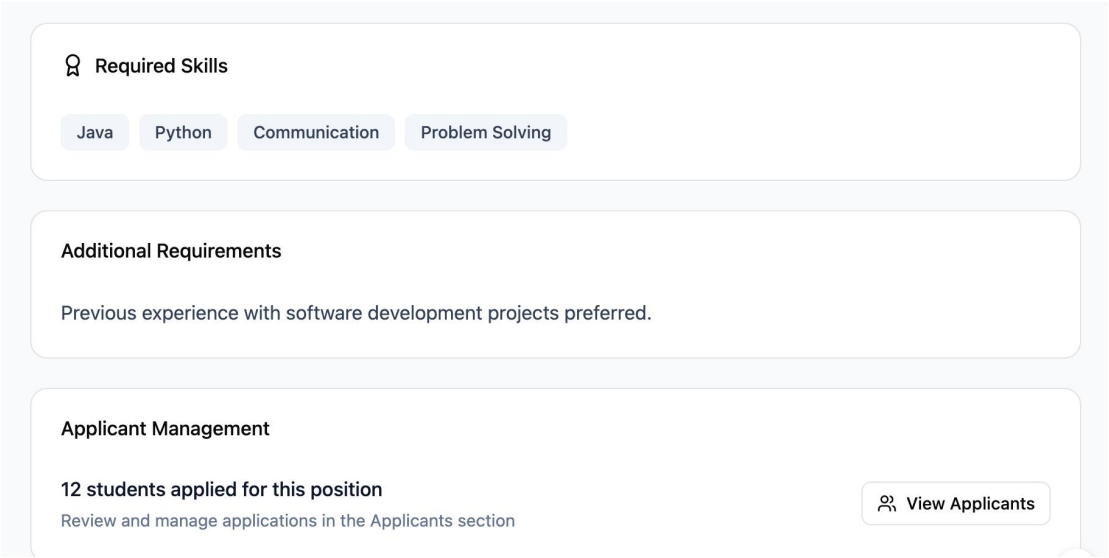
The form layout is clearly divided into three logical sections to guide the user seamlessly. First, in the "Basic Information" section, the MO is required to fill out mandatory fields marked with an asterisk, including the Job Title, Module Code, Module Name, Quota (Number of TAs needed), and Expected Weekly Hours. Next,

the "Detailed Requirements" section allows the MO to elaborate on the Job Description, input specific Required Skills (where typing a skill and pressing Enter creates a clear tag for backend matching), and provide any Additional Requirements (Optional). Finally, the "Publish Settings" section features a convenient toggle switch ("Publish Immediately"). This allows the MO to decide whether the job posting should be instantly visible to students or kept hidden as a draft.

After completing the form, the MO clicks the "Publish Job" button at the bottom right. The system validates the mandatory inputs, creates a new job record, saves it to the backend file system, and redirects the user back to the job list. Alternatively, clicking "Cancel" (or the "< Back" button at the top) will discard all current inputs and safely return the MO to the previous page.

(3) Job Detail



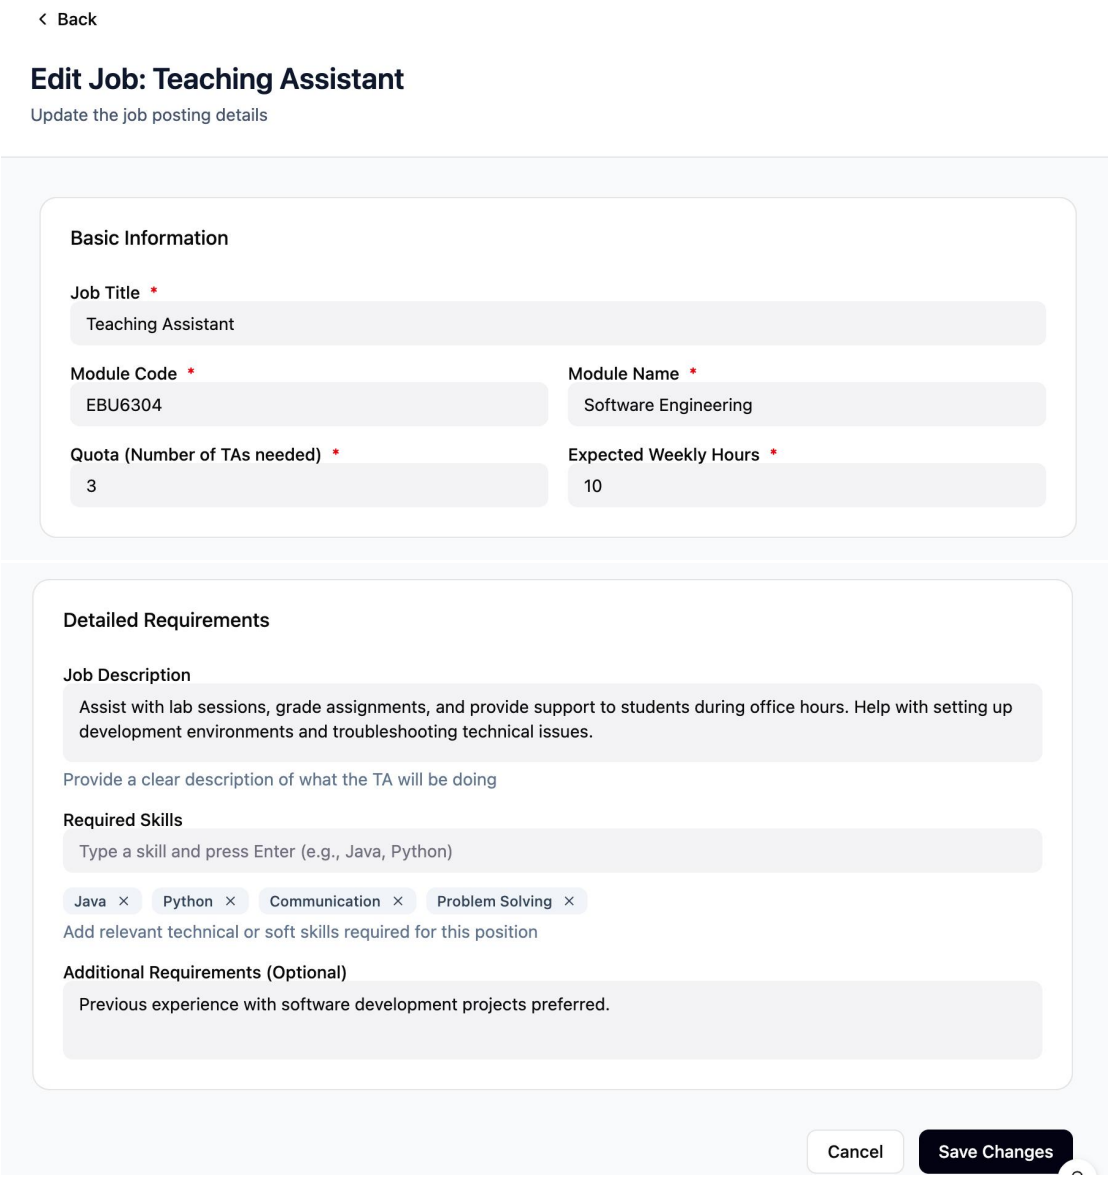


When the MO clicks the "eye" icon on the My Jobs list, the system navigates to the Job Detail page. This page serves as the single source of truth for a specific job posting, presenting a comprehensive read-only view of all job attributes.

At the top right corner, a dedicated action bar provides the MO with high-level control over the job's lifecycle, featuring "Edit Job", "Close Job", and "Delete" buttons. Below the header, the core information area prominently displays the current status badge (e.g., Open), the associated Module (e.g., EBU6304 - Software Engineering), and three distinct metric cards highlighting the Quota, Hours/Week, and current number of Applicants.

The main body of the page is logically sectioned to display the qualitative data: Job Description, Required Skills (rendered as distinct visual tags like Java and Python), and Additional Requirements. Crucially, at the bottom of the page, the "Applicant Management" section summarizes the application volume and provides a "View Applicants" button. Clicking this button acts as a seamless workflow bridge, instantly transferring the MO from the Job Management module to the Application Review module to begin screening candidates.

(4) Edit Job



When the MO needs to update an existing recruitment demand, clicking the "pencil" icon from the Job Management list or the "Edit Job" button from the Job Detail page will navigate them to the Edit Job page. This page is crucial for maintaining the accuracy and timeliness of job postings throughout their lifecycle.

The layout of this page mirrors the "Create New Job" form, ensuring a consistent user experience. However, upon entry, the system automatically pre-fills all input fields with the specific job's current data retrieved from the backend file. In the "Basic Information" section, the MO can adjust parameters such as the Quota or Expected Weekly Hours. In the "Detailed Requirements" section, they can refine the Job Description or modify the Required Skills by easily adding new tags or clicking

the "x" on existing tags (e.g., Java, Python) to remove them.

Once all necessary modifications are made, the MO clicks the "Save Changes" button at the bottom right. The system validates the updated inputs and overwrites the specific job record in the backend storage. The user is then safely redirected back to the updated Job Detail or Management list. If the MO decides not to proceed with the updates, clicking "Cancel" will discard any unsaved changes.
